Reflection:

This task had a considerable learning curve, going from html and CSS to implementing vue 3 into the webpages took quite a bit of time to learn and start adding it into my app.js file using vue 3 to handle events and conditional events and styling the vue 3 elements with CSS and having each element working together correctly. The @click event handling was present on the toggle button with conditional programming with the v-if and v-else statements controlling the colour of the background of the text and which text was displayed, the add button would push any text into the list of tasks to complete. The v-model function was used to connect the input fields on the newTodo pushing the list items when the add button click event occurred and then again on the todo.done property when the check box was clicked by the user. The elements created are still roughly designed and I want to continue learning more about using vue 3 to create more advanced applications in the future and find more tasks to grow these skills
